AUREPROOF

Evidence you can check for AI agent evals

Open source. Signed, re-scorable results and a gate that can say “inconclusive”.

Bindu Bhargava R Chintam, solo founder

github.com/bhargavchintam/aureproof

THE PROBLEM

Agent eval results are hard to trust

Broken tasks still count

A task with a broken grader still adds to the score. OpenAI found 59.4% of 138 audited SWE-bench Verified tasks flawed.

Results can’t be re-checked

Scores travel as a number. Nobody outside the team can confirm how it was made.

Noise gets called a win

Fixed thresholds can’t say “too close to call”, so a lucky run looks like progress.

Source: OpenAI, “Why SWE-bench Verified no longer measures frontier coding capabilities”, Feb 2026

WHY NOW

Security agents are shipping, and false alarms have a real cost

15% → <5%

Share of curl bug reports that were real, before curl ended its bug bounty in January 2026.

Bugcrowd changed its rules for “AI slop” as queues rose over 334%.

A security agent is only useful if its findings are real.

Sources: daniel.haxx.se, Jan 2026; Bugcrowd blog, Mar 2026

THE SOLUTION

Three checks, end to end

Health record. A task counts only if its grader passes controls.

Signed bundle. Anyone can verify and re-score the run offline.

Fixed gate. Pass, fail or inconclusive, with rules set before the run.

Every failure stops the run.

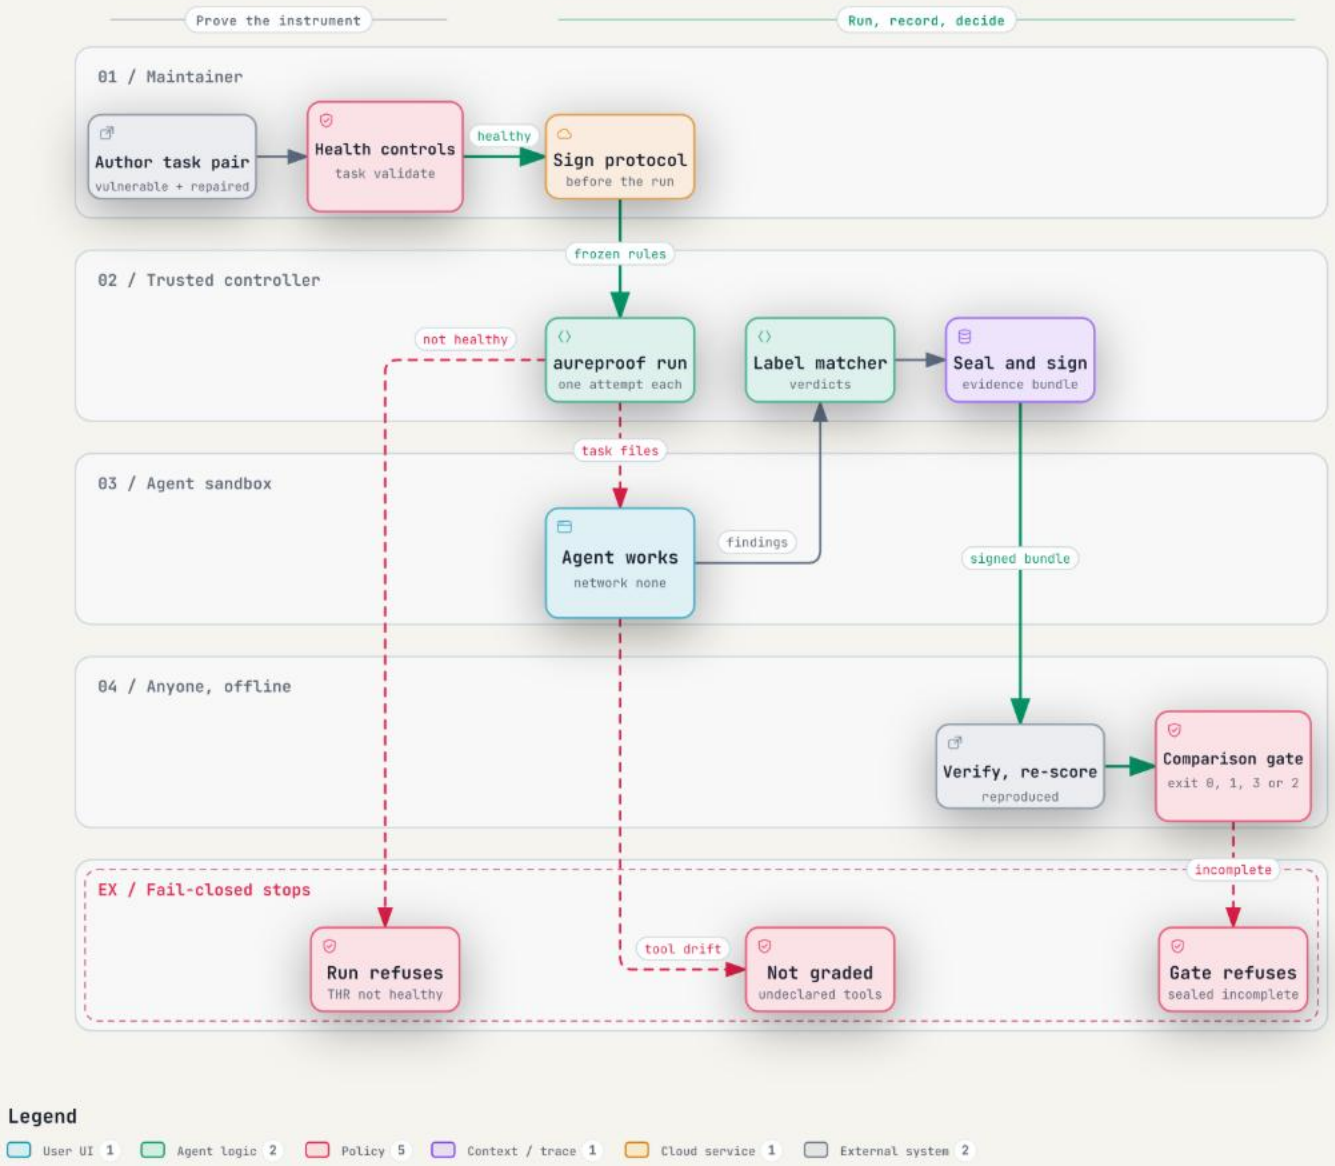

Diagram made with Archify; every box cites code on main

A REAL RUN

A live agent run anyone can check offline

```
$ aureproof validate bundles/m2-slice-2 \
    --require-signature
V5 signature   pass  (sign.yml on main)
VALID

$ aureproof score bundles/m2-slice-2 --offline
re-score: reproduced
known_defect_recall       3/3
strict_confirmed_yield    3/12
```

Claude Code with Claude Haiku 4.5 on 3 task pairs, one attempt each.

It found all 3 planted bugs. Only 3 of its 12 findings were real.

Recall alone would call that perfect.

A demonstration of the chain, not a benchmark result. Bundle and commands are in the public repo.

BUILT TODAY

Three weeks of work, all in the open

104	791	90	0.1.0a1
commits	tests	merged PRs	alpha on PyPI

Built

Three open specs, the Inspect runner, Sigstore signing, the gate and 14 healthy draft task pairs.

Not yet

Users, design partners, an outside reviewer, and a benchmark result on real agents.

First commit October 10, 2026. Solo, part-time. Counts as of November 1.

CUSTOMER AND BUSINESS

Free open core, paid trust services

Who uses it first

Teams building AI security agents who need a false-alarm rate they can show buyers.

Eval teams deciding if a new model or agent really improved.

How it makes money

Free: the Apache-2.0 tool, specs and public tasks.

Paid: hosted verification, private held-out runs and signed audit reports. No revenue yet.

Later: buyers, auditors and regulated teams checking a vendor’s claims

COMPETITION

A layer on top of existing tools

Tool	Task health	Signed results	3-way call
Inspect AI	admission checks	re-score, unsigned	error bars
Harbor	admission checks	regrade, unsigned	no
Braintrust, LangSmith	not the focus	hosted logs	thresholds
Aureproof	**kept per task**	**Sigstore signed**	**yes**

Runs on Inspect, exports to Every Eval Ever, plans fixes upstream.

FOUNDER

Bindu Bhargava R Chintam

Research Scientist, Research Foundation for SUNY · M.S. CS, Stony Brook

MEASUREMENT

About 6 years of applied ML and data engineering: genomics, ICU, 5G, enterprise.

RESEARCH

7 publications and 3 patents, one granted in Australia (AU 2021102414).

AGENT SECURITY

Co-built Tripwire, runtime security for AI agent fleets, at SF Tech Week, Oct 2026.

Open-source contributor to Spack and nf-core. Solo founder, part-time today.

NEXT 3 MONTHS

From working code to first real users

MONTH 1

Talk to 10 to 15 eval and security-agent teams. Decide go or narrow.

MONTH 2

Two or three design partners run it on their own runs.

MONTH 3

Ship v0.1.0 with the first signed assessment.

The ask

Funding to go full-time from November 1, 2026, and introductions to teams running agent evals.
